

# RockProp

## The Cuttings Alliance is offering a new way to log wells:

- We bring mud logging, advanced cuttings analysis and reservoir interpretation under one roof to reduce costs and improve well performance.
- **RockProp** integrates drilling data, mud gas, logs and laboratory measurements of cuttings to derive reservoir parameters for vertical and horizontal wells.
- From standard analytical data (TOC, XRF/XRD) and basic rock measurements (grain and bulk density) porosity, fluid properties and mineralogy are determined.
- **RockProp** identifies regional variations in geology, fluids and reservoir which allows for cheaper and more efficient completions.
